Foreward

The evolution of the subspecialty of Neonatology during the past four decades has been a remarkable one, leading to improvements in both survival and quality of outcome that are nearly unsurpassed in modern medicine. Infants with a variety of surgical problems, congenital heart disease, severe lung disease, and congenital malformations, whose survival was once deemed hopeless, now frequently live normal, highly productive lives. Most striking, perhaps, is the outcome of the extremely low birth weight neonate. Infants below 1000 g in the 1970’s rarely survived, yet intact survival is now the norm and developmental outcomes in these patients improve on an annual basis. These results have made it seem as if anything is possible in the NICU, and the management of even the most complex cases at times looks fairly routine.

Because of this amazing success in the NICU population, however, one class of neonates has, perhaps, not received the attention it deserves, namely the late preterm infant. Because the appearance of these infants so closely resembles the full term infant, and because the practice of neonatal medicine has improved so dramatically, the late preterm infant has often been erroneously viewed as merely a slightly smaller version of the term infant, with a similarly modest set of potential problems. The past decade, however, has revealed this assessment to be far from the truth, and the late preterm infant has been found to have a constellation of problems that require as much skill and planning as any complex NICU patient. Issues of respiratory distress, hypoglycemia, hyperbilirubinemia, sepsis, feeding problems and other concerns occur far more frequently in this class of infants than has been previously recognized, and survival itself has more of a problem than was formerly appreciated.

Because the recognition of the problems of the late preterm infant has been a relatively recent development in Neonatology, few evidence-based approaches to the management of these patients have been published for the various care providers who interact with them. With the production of Multidisciplinary Guidelines for the Care of Late Preterm Infants, the National Perinatal Association, in collaboration with many expert individuals and organizations, has performed a long overdue service for caregivers that will prove invaluable to physicians, midwives, nurses, ancillary members of the healthcare team, and, most importantly, the parents of late preterm infants. The methodical approach to the evaluation and management of these neonates, thoroughly supported by up-to-date references, will serve as an ideal road map to improve the outcomes for these infants. I would urge all neonatal providers to carefully read this manual and adopt these carefully considered and clearly outlined strategic approaches to the care of the late preterm infant.

Alan R. Spitzer, MD
Senior Vice President for Research, Education, and Quality
MEDNAX, Inc. / Pediatrix Medical Group/ American Anesthesiology
INTRODUCTION

Multidisciplinary Guidelines for the Care of Late Preterm Infants

Of the 500,000 premature babies born each year in the United States, nearly 75% - or 375,000 - of them are born at 34 0/7 through 36 6/7 weeks of gestational age (GA). These infants are referred to as “late preterm infants” (LPI) by many who publish research and commentaries about their care, including the consensus panel at the Eunice Kennedy Shriver National Institute of Child Health and Human Development (NICHD).\(^1\) Late preterm infants are physiologically and metabolically immature at the time of birth, often lacking the self-regulatory ability to respond appropriately to the extra-uterine environment. Despite their appearance as small but “normal” babies, LPIs have higher rates of morbidity and mortality than their term counterparts, not only during birth hospitalization, but also throughout the first year after birth and beyond.\(^2\)

In some hospitals, LPIs account for up to 20% of admissions to the NICU, and LPIs are more likely to be re-hospitalized within the first 2 weeks of discharge.\(^3\)\(^4\)\(^5\) The morbidity rate approximately doubles for every week below 38 weeks gestational age that a baby is born (38 weeks: 3.3%; 37 weeks: 5.9%; 36 weeks: 12.4%; 35 weeks: 25%; 34 weeks: 51.2%).\(^6\)

Because of these inherent risks, LPIs require increased surveillance and monitoring of the mother-infant dyad to direct their healthcare needs. The level and intensity of care provided should be based on ongoing assessment of the infant’s physiological status and availability of services and personnel within the birthing facility, so that any needed interventions can occur quickly to prevent permanent consequences.

With appropriate awareness of potential risks, the care of many LPIs can be managed in the postpartum setting, and the Multidisciplinary Guidelines for the Care of Late Preterm Infants are focused on these infants. However, some infants may require transfer to a higher level of care for suitable management and monitoring.

A multidisciplinary approach to caring for the LPI is recommended. Care should be implemented and coordinated by clinicians within their scope of practice and should be family-centered, developmentally supportive, and within the context of the family’s culture and preferences. Communication should occur and education should be provided in ways that are appropriate for individual family needs, including families with limited or no English proficiency or health literacy. Care standards should always be of the highest quality but may require different methods of implementation.
Development of the “Multidisciplinary Guidelines for the Care of Late Preterm Infants”

In response to increasing national awareness of the problems resulting from premature birth, discussions have been held across the nation among healthcare providers and premature infant advocates to explore the many issues surrounding prematurity and the care of preterm infants. During these discussions, one recurring topic has been the growing concern about a category of premature infants known as “late preterm infants.” While several organization- and hospital-based guidelines are available for the care of this special population of infants, there is no evidence-based uniformity among them. In addition, while evidence for both short- and long-term consequences of late preterm birth is mounting, most existing guidelines focus on the in-hospital experience with little or no guidance for short- or long-term follow-up.

In 2010, the National Perinatal Association hosted a Summit, entitled Multidisciplinary Guidelines for the Care of Late Preterm Infants, to explore ways to address this need. The Summit was attended by 29 multidisciplinary experts representing 20 different organizations involved in the care of late preterm infants. During this day-long working meeting, the participants divided into five topic-based groups to review current guidelines in order to determine where consensus already existed, recognize differences in practice, identify gaps with no guidelines available, and establish a course of action to address the results. At the end of the day, there was unanimous agreement on the need for synthesizing the existing guidelines into a multidisciplinary, consensus, and evidence-based set of guidelines to increase uniformity of care for late preterm infants.

A Steering Committee continued the work begun during the Summit. After a draft of the guidelines was completed, each participant of the original Summit had the opportunity to review the document. Because these valuable suggestions and contributions were incorporated, the guidelines are truly multidisciplinary. Use of the latest references relevant for each recommendation helped ensure that the guidelines are evidenced-based.

For ease of use, the guidelines are divided into four sections: 1) In-Hospital Assessment and Care; 2) Transition to Out-Patient Care; 3) Short-Term Follow-Up Care; and 4) Long-Term Follow-Up Care. Within each section, the guidelines are further divided into four subsections: 1) Stability; 2) Screening; 3) Safety; and 4) Support. Each guideline includes recommendations for the Healthcare Team and for Family Education are provided for each guideline included.

It is our hope, as members of the Steering Committee, that you and your organization will find the Multidisciplinary Guidelines for the Care of Late Preterm Infants to be useful, practical, and relevant. It is also our hope that by increasing uniformity of care for late preterm infants, the guidelines will help to increase survival and decrease morbidity for this vulnerable population of infants. Finally, we hope the guidelines will assist staff in providing clear and consistent messages of both caution and guidance for parents and families of late preterm infants and, in doing so, will enhance and safeguard what should be a time of joyous celebration around the birth (even if sooner than planned) of their new baby.

Raylene Phillips, MD, IBCLC, FAAP
Steering Committee Chairperson
In-Hospital Assessment and Care

Late preterm infants (LPIs), like all other newborns, should have a qualified healthcare provider assigned to their care during the immediate postpartum recovery period following birth. Late preterm infants may experience delayed or inadequate transition to the extra-uterine environment, so careful consideration of staffing ratios during transition (1–12 hours after birth) for this population of infants is necessary. Because of their increased vulnerabilities, LPIs require continued close monitoring throughout the first 24 hours after birth. Whenever possible, mother and infant should remain together, rooming in 24 hours a day. Frequent, prolonged, skin-to-skin contact should be encouraged to promote optimal physiological stability. All LPIs are at risk for morbidities severe enough to require transition to a higher level of care. If a LPI is transitioned to a higher level of care, special attention should be paid to preparing the mother for going home without her newborn, and she should be monitored closely for signs of postpartum depression and post-traumatic stress disorder in the postpartum period.

*When communicating with families and providing education as listed in the Family Education column, concepts should be shared in a manner appropriate for the needs of the family including those whose first language is not English.

<td>• Identify maternal risk factors that can affect infant’s initial stability (e.g., diabetes, medications, or illicit drugs).</td>
<td></td>
</tr>
</tbody>
</table>
### HEALTHCARE TEAM

#### STABILITY (continued)

**Reducing Risks of Respiratory Distress**

- Monitor infant’s RR and work of breathing closely by visual inspection during first hour after birth.
- Maintain skin-to-skin contact if stable to decrease infant stress, optimize respiration and oxygen saturations, and protect from hypothermia-induced apnea.
- If signs of respiratory distress are present and persist, evaluate with pulse oximeter, stabilize infant, and consult with next level perinatal care provider about transferring infant to higher level of care.

**Reducing Risks of Hypothermia**

- Maintain neutral thermal environment.  
  » Dry infant gently after birth.
  » Continue skin-to-skin care with parent whenever possible.
  » Cover infant’s back with warmed blanket.
  » Keep hat on infant when not in skin-to-skin contact.
  » Use a pre-warmed blanket during weighing.
  » Keep infant’s bed away from air vents and drafts.
- Prevent heat loss when skin-to-skin care is not an option or is ineffective in maintaining infant’s temperature.  
  » Swaddle with double wrap.
  » Increase ambient temperature.
  » Use radiant warmer or incubator.
  » Assess axillary temperature to ensure 97.7–99.5°F (36.5–37.5°C) q 30 min × 1 h, then q 4 h for first 24 h, then q shift until transition/discharge.
- Postpone bath until thermal, respiratory, and cardiovascular stability is well established (typically 2–12 h after birth).  
  » Consider partial rather than whole-body bathing.
  » Dry infant immediately after bath and cover infant’s head with dry hat.
  » Place infant in skin-to-skin contact with mother, if possible, for optimal warming.
- If temperature instability occurs, take actions to stabilize. If instability persists, consult with next-level perinatal care provider about transferring infant to higher level of care.

**Reducing Risks of Sepsis**

- Identify maternal and neonatal risk factors:  
  » Maternal Group B Strep (GBS)-positive or unknown status with inadequate antenatal antibiotic prophylaxis
  » Chorioamnionitis/maternal fever >100.4°F (38.0°C)
  » Maternal cold or flu-like symptoms
  » Prolonged (≥18 h) rupture of membranes
  » Fetal instability during labor or delivery

### FAMILY EDUCATION*

- Explain LPI’s increased risk for respiratory distress and apnea, including:
  » Immature lung development
  » Decreased surfactant level
  » Immature control of breathing
  » Decreased airway muscle tone leading to decreased ability to protect airway
- Teach how to recognize signs of respiratory distress and apnea and when to alert healthcare provider for immediate evaluation of infant.

- Explain LPI’s increased risk for hypothermia:  
  » Decreased brown fat (thermogenesis) and white fat (insulation)
  » Increased heat loss due to higher surface-area-to-mass ratio
- Teach importance of skin-to-skin contact in keeping infant warm.
- Stress importance of adequate clothing when not in skin-to-skin contact.
- Teach how to take infant’s temperature accurately.

* Teaches the family about the neonate’s health and focuses on how to reduce risk and maintain the infant’s stability.

<td></td>
</tr>
<tr>
<td>» Low glycogen stores</td>
<td></td>
</tr>
<tr>
<td>» Immature metabolic pathways to make glucose</td>
<td></td>
</tr>
<tr>
<td>• Explain any additional risk factors for hypoglycemia that may be present.</td>
<td></td>
</tr>
<tr>
<td>• Stress importance of feeding infant frequently, at least 10–12 breastfeedings or 8–10 formula feedings per day.</td>
<td></td>
</tr>
<tr>
<td>• Teach how to recognize symptoms of hypoglycemia and when to alert healthcare provider for immediate evaluation of infant.</td>
<td></td>
</tr>
</tbody>
</table>
### STABILITY (continued)

#### Reducing Risks of Feeding Difficulties

- Identify maternal risk factors that may affect successful breastfeeding:
  - Multiple gestation
  - Diabetes
  - Pregnancy-induced hypertension
  - Chorioamnionitis
  - Cesarean delivery
- Provide assistance as needed to ensure adequate feeding frequency, at least 10–12 breastfeedings or 8–10 formula feedings per day.
- Maintain nursing staff lactation competencies consistent with scope of practice and responsibilities.
- Provide a dedicated lactation consultant, ideally an International Board Certified Lactation Consultant (IBCLC), whenever possible.
- Provide (or refer to) a feeding specialist (occupational or physical therapist or speech/language pathologist) to evaluate infants with persistent feeding difficulties.
- Adopt the Baby Friendly Hospital Initiative’s Ten Steps to Successful Breastfeeding whenever possible (www.babyfriendlyusa.org/eng/10steps.html).

- Explain LPI’s increased risk for inadequate feeding:
  - Immature suck/swallow/breathe coordination
  - Inadequate breastmilk transfer due to low muscle tone, ineffective latch, and decreased stamina
  - Low milk supply due to inadequate breast emptying
- Stress the value to mother and baby of exclusive breastmilk feeding.
  - Explain the value of colostrum in providing immune protection and nutrition.
  - Reassure mothers that small amounts of colostrum are usually adequate in the first few days if baby is feeding frequently enough.
- Teach how to recognize early feeding cues:
  - Opening eyes
  - Moving head back and forth
  - Opening mouth, tongue thrusting, rooting, or sucking on hands/fingers
  - Crying (a late hunger cue often leading to difficulty with latch due to infant frustration)
- Explain the probable need to awaken infant for feeds due to LPI’s immature brain and increased sleepiness.
  - Infant will transition to full cue-based feeds when closer to term gestational age.
- Encourage mothers to ask for assistance as needed with breastfeeding or formula feeding.

#### First Breastfeeding

- Assess mother’s desire to breastfeed as well as her knowledge and level of experience.
- Facilitate immediate, uninterrupted, and extended skin-to-skin contact for stable infants until after the first breastfeeding (usually within first 1–2 h).

- Remind mother that babies are born to breastfeed.
  - Review benefits of breastfeeding for baby: decreased risk of infection, diarrheal illness, Sudden Infant Death Syndrome (SIDS), and obesity.
  - Review benefits for mother: decreased risk of breast cancer, ovarian cancer, and osteoporosis.
  - Review risks of formula feeding, e.g., increased risk of infection due to increased gastric pH and change in gut flora, risk of cow protein allergy, increased risk of SIDS (www.health-e-learning.com/articles/JustOneBottle.pdf).
  - Explain reasons for formula use if formula is medically indicated.
  - Explain the importance of early and prolonged skin-to-skin contact:
    - Promote optimal physiological stability
    - Facilitate the first breastfeeding
### Healthcare Team

# Newborn Screening

**References:**
55, 56, 73, 74, 75

- Ensure familiarity with requirements of individual state’s newborn screening mandates. ([www2.aap.org/healthtopics/newbornscreening.cfm](http://www2.aap.org/healthtopics/newbornscreening.cfm))
- Document date and time of state-required newborn screening.
  - Screening should be done 24 h after feeding is initiated.
  - Document plan to repeat test if screening performed earlier.
- Document results, if available.
- Report abnormal results or plans for repeat testing to primary care provider.
  - Document that intended recipient received information sent.

**FAMILY EDUCATION*:**

- Explain reasons for newborn screening.
- Stress importance of asking primary care provider about results of newborn screening.
- Stress importance of any follow-up that is indicated:
  - Date, time, and location of follow-up appointment

---

# Hearing

**References:**
2

- Perform hearing screen prior to transition/discharge.
- Document hearing screening date and results.
- Make referral to audiology service if indicated.

**FAMILY EDUCATION*:**

- Explain reasons for hearing screening.
- Reinforce understanding of hearing screening procedure.
- Stress importance of any follow-up that is indicated:
  - Date, time, and location of follow-up appointment
- Explain that screening does not always diagnose a hearing deficit and that the need for follow-up does not always mean that the infant is impaired.

---

# Anomalies

**References:**
93

- Evaluate infant for congenital anomalies.
- Consider pulse oximetry screening for congenital heart defects per hospital protocol.

**FAMILY EDUCATION*:**

- Explain any physical or internal anomalies found.
- Stress importance of any follow-up that is indicated.
  - Date, time, and location of follow-up appointment

---

# Maternal Screening

**References:**
36, 37, 38, 39, 40, 41, 42

- Review maternal blood type.
- Review prenatal lab results and risk factors.
  - Be aware of Center for Disease Control and Prevention (CDC) recommendations for HIV screening and treatment.
- Review ingestion of illicit and prescription drugs or other substances during pregnancy and refer mother to drug or alcohol rehabilitation program, if indicated.
- Review use of prescription or herbal medications or supplements of concern, if identified.
- Review smoking history (present or past use).
  - Refer family members who smoke to smoking cessation program.
  - Encourage mothers who quit smoking during or just prior to pregnancy to avoid relapse (high risk during the postpartum period).
- Screen for psychiatric illness or perinatal mood disorders (including postpartum depression and post-traumatic stress disorder).
  - Parents separated from the infant at birth (e.g., due to cesarean delivery or NICU admission) are at higher risk for perinatal mood disorders.
  - Mothers of infants born prematurely are at increased risk for mood disorders in the first 6 months postpartum (three times higher than mothers of term infants).
- Make referrals for treatment if indicated.
- Evaluate mother’s understanding of any referrals made.
- Provide referrals to smoking cessation, drug or alcohol treatment, psychiatric, or support services, if indicated.
- Explain risks of secondhand smoke exposure.
  - Stress importance of providing a smoke-free environment for all infants and children, especially those born prematurely.
  - Secondhand smoke exposure is associated with apnea, SIDS, behavior disorders, hyperactivity, oppositional defiant disorder, sleep abnormalities, and upper respiratory infections.
- Explain risks and benefits of prescription and herbal medications and supplements, if indicated.
- Provide information about the signs and symptoms of postpartum depression and post-traumatic stress disorder, and encourage parents to seek help if needed.
### SAFETY

**In-Hospital Safety**

- Model proper hand hygiene when handling baby or feeding equipment.
- Model proper equipment, positioning, and monitoring of the newborn for bathing, diapering, and routine care.
- Model safe sleeping practices when placing baby in bed.

**References:**

- Teach importance of handwashing before handling baby or feeding equipment.
- Teach proper use of:
  - Bulb syringe to suction nares, if needed
  - Thermometer to take auxiliary temperature
- Teach about safe bathing procedures, bath temperature, and maintaining a neutral thermal environment during bathing and care.
- Stress importance of placing babies on their backs to sleep in hospital and at home.

### SUPPORT

**Staff Support**

- Assess adequacy of staff support for physicians, midwives, nurses, lactation and feeding specialists, social workers, occupational therapists, physical therapists, case managers, transition/discharge planners, and home health services, including:
  - Availability of staff to support level of services offered
  - Staffing ratios
  - Competencies and skills
  - Availability of referral services

- Explain roles of multidisciplinary staff.
- Provide case manager evaluation to initiate transition/discharge planning process.

**Family Support**

- Assess adequacy of family support including:
  - Partner’s presence, involvement, and coping
  - Grandparents and/or friends
- Provide social worker evaluation of special needs as indicated.

- Provide contact information for support resources as indicated.
- Reinforce potential challenges of caring for LPI at home and encourage use of any needed resources.
Transition to Outpatient Care

Transition of care involves a set of actions designed to ensure continuity of care from inpatient to outpatient healthcare providers. Planning for transition of care should begin at the time of admission and requires a coordinated, multidisciplinary approach. The term “transition of care” is preferred to the term “discharge planning” in order to emphasize the active and dynamic nature of this process.

Optimal transition of care relies on accountable providers who ensure that accurate and complete information is successfully communicated and documented. The accountable sending provider sends the appropriate documents to the receiving provider in a timely manner, verifies the receipt of the information by the intended receiving provider, clarifies the receiving provider’s understanding of the information sent, documents the transaction, and resends information if not received by the intended recipient. The accountable receiving provider acknowledges having received the documents and asks any questions for clarification of the information contained therein, uses the information, and takes actions as indicated, ensuring continuity of the plan of care or services.43

*When communicating with families and providing education as listed in the Family Education column, concepts should be shared in a manner appropriate for the needs of the family including those whose first language is not English.

### SCREENING

#### Newborn Screening
- Ensure familiarity with requirements of individual state’s newborn screening mandates.
- Document date and time of state-required newborn screening.
  » Ensure that screening is be done 24 h after feeding is initiated.
  » Document plan to repeat test if screening performed earlier.
- Document results, if available.
- Report abnormal results or plans for repeat testing to primary care provider.
  » Document that intended recipient received information sent.

#### Hearing
- Review hearing screen test date and results.
- Make referral to audiology service if indicated.

#### Anomalies
- Document any congenital anomalies.
- Consider pulse oximetry screening for congenital heart defects per hospital protocol.
  If screen is done, document results.

#### Maternal Screening
- Review maternal blood type, prenatal lab results, and risk factors.
- Review ingestion of illicit and prescription drugs or other substances during pregnancy and any referrals for drug or alcohol rehabilitation program.
- Review use of prescription or herbal medications or supplements of concern, if identified.
- Review smoking history (present or past use)
  » Refer family members who smoke to smoking cessation program.
  » Encourage mothers who quit smoking during or just prior to pregnancy to avoid relapse (high risk during the postpartum period).
- Screen for psychiatric illness or perinatal mood disorders (including postpartum depression and post-traumatic stress disorder).
  » Parents separated from the infant at birth (e.g., due to cesarean delivery or NICU admission) are at higher risk for perinatal mood disorders.
  » Mothers of infants born prematurely are at increased risk for mood disorders in the first 6 months postpartum (three times higher than mothers of term infants).
  » Make referrals for treatment if indicated.
- Evaluate mother’s understanding of any referrals made.

### FAMILY EDUCATION*

#### Newborn Screening
- Reinforce reasons for newborn screening.
- Stress importance of asking primary care provider about results of newborn screening tests.
- Stress importance of any follow-up that is indicated:
  » Date, time, and location of follow-up appointment

#### Hearing
- Reinforce understanding of hearing screening procedure.
- Stress importance of any follow-up that is indicated:
  » Date, time, and location of follow-up appointment
- Explain that screening does not always diagnose a hearing deficit and that the need for follow-up does not always mean that the infant is impaired.

#### Anomalies
- Explain any physical or internal anomalies found.
- Stress importance of any follow-up that is indicated:
  » Date, time, and location of follow-up appointment

#### Maternal Screening
- Provide referrals to smoking cessation, drug or alcohol treatment, psychiatric, or support services, if indicated.
- Explain risks of secondhand smoke exposure.
  » Stress importance of providing a smoke-free environment for all infants and children, especially those born prematurely.
  » Secondhand smoke exposure is associated with apnea, Sudden Infant Death Syndrome (SIDS), behavior disorders, hyperactivity, oppositional defiant disorder, sleep abnormalities, and upper respiratory infections.
- Explain risks and benefits of prescription and herbal medications and supplements, if indicated.
  » Where medications are indicated, encourage use of medications compatible with breastfeeding, if possible.
- Provide information about the signs and symptoms of postpartum depression and post-traumatic stress disorder and encourage parents to seek help if needed.
### HEALTHCARE TEAM

#### SCREENING (continued)

**Parent-Infant Bonding**

- Assess family, home, and social risk factors that may affect bonding.
- Assess signs of attachment:
  - Infant’s ability to demonstrate cues
  - Parents’ ability to recognize and respond appropriately to infant’s cues

**References:** 77

#### SAFETY

**Family Risk Factors**

- Document screening done and referrals made for the following:
  - Drug or alcohol use in home
  - Smokers in home
  - Domestic violence
  - Mental health issues
  - Social services involvement
- Evaluate parent’s understanding of any referrals made.

**References:** 41, 57, 76, 77

**Home Environment**

- Assess parents’ knowledge of how to make the home environment safe for infants.
- See Tips and Tools, Safety for Your Child (www.healthychildren.org/English/tips-tools/Pages/default.aspx)
- Document screening and referrals made for the following:
  - Adequate housing/shelter
  - Utilities
  - Phone
  - Fire alarms
  - Transportation

**Safe Sleep**

- Document education about safe infant sleep practices provided.

**References:** 24, 94, 95, 96, 97, 98, 99

**Infection & Immunizations**

- Document education provided.
- Give hepatitis B vaccine prior to transition/discharge.
  - If parents defer until 2-month vaccine schedule or defer entirely, document the decision.
- Give respiratory syncytial virus (RSV) prophylaxis and recommendations for repeat dosing as indicated.
- See Talking with Parents about Vaccines for Infants (www.cdc.gov/vaccines/spec-grps/hcp/conv-materials.htm#talkpvi)

**References:** 2, 18, 53, 54, 57, 78, 79, 80, 81, 82, 83

### FAMILY EDUCATION*

- Reinforce parents’ understanding of infant cues.
- Encourage frequent and prolonged skin-to-skin contact with both parents.

- Provide written and verbal information about available support services, if indicated.

- Teach ways to make the home environment safe for infants.
- Stress importance of adequate shelter for infant.
- Provide written and verbal information about available support services, if indicated.
- Review family’s plan for communication with and transportation to primary care provider for infant follow-up visits.

- Reinforce the LPI’s increased risk for SIDS.
- Provide written and verbal information about placing infant on his/her back to sleep and on tummy to play.
- Explain unsafe sleeping practices.
- Recommend use of pacifier after first month after birth.

- Review ways to reduce illness.
  - Wash hands, limit visitors, avoid crowds, protect against contact with sick people.
  - Breastfeed for as long as possible during the first year after birth or longer.
- Stress importance of infant immunizations.
- Stress importance of flu shots and pertussis boosters for family and care providers.
- Provide written and verbal information about RSV prophylaxis and prevention.
<table>
<thead>
<tr>
<th>HEALTHCARE TEAM</th>
<th>FAMILY EDUCATION*</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>SAFETY (continued)</strong></td>
<td></td>
</tr>
</tbody>
</table>
| **Car Seat Safety** | - Ensure parents have a car seat or assist them in procuring one.  
- Ensure car seat testing is done in the same car seat infant will use after transition/discharge.  
  » A trained professional should teach proper use of car seat.  
- Arrange for a car bed if the infant fails the car seat test. |
| **References:** 84 | - Instruct parents to bring their own car seat in for testing.  
- Provide written and verbal instruction on proper use of car seat:  
  » Correct way to secure car seat in car  
  » Correct way to secure infant in car seat  
  » Age of transition to front-facing car seat |
| **Shaken Baby Prevention Education** | - Provide shaken baby syndrome information and explanation using visual aids and document viewing prior to transition/discharge. |
| **References:** 117 | - Provide written and verbal instruction about risks of shaking baby.  
- Teach ways to calm infant.  
- Teach ways to cope with crying infant. |
| **When To Call 911 or Local Emergency Number** | - Assess parents’ understanding of when to call 911. |
| | - Teach how to recognize life-threatening events and when to call 911, including:  
  » Apnea  
  » Choking  
  » Difficulty breathing  
  » Cyanosis  
- Teach CPR. |
| **When To Call Primary Care Provider** | - Assess parents’ understanding of when to call primary care provider. |
| | - Teach how to recognize signs of illness and when to call primary care provider, including:  
  » Lethargy  
  » Fever, hypothermia  
  » Poor skin color  
  » Decreased urine output  
  » Abdominal distension  
  » Vomiting  
  » Bloody stool  
  » Inconsolable infant  
  » Uncertainty about significance of infant’s symptoms |
## HEALTHCARE TEAM

**Staff Support**
- Assess adequacy of staff support for physicians, midwives, nurses, lactation and feeding specialists, social workers, occupational therapists, physical therapists, case managers, transition/discharge planners, and home health services
  - Availability of staff to support level of services offered
  - Staffing ratios
  - Competencies and skills
  - Availability of referral services

**Family and Social Support**
- Evaluate support needs and address barriers to care:
  - Family / Social support network
  - Community-based services (e.g., WIC, lactation support, social services)
  - Home health care referral
  - Ongoing infant care education
- Ask parents if they have any questions or concerns that have not already been addressed.
- Provide a call-back number for general questions that come up after when family is home.

## FAMILY EDUCATION*

**Staff Support**
- Explain roles of multidisciplinary staff.

**Family and Social Support**
- Provide written and verbal information about available resources, if indicated.
- Reinforce potential challenges of caring for LPI at home and encourage use of needed resources.

## TRANSFER OF CARE

**Primary Care Provider**
- Identify community primary care provider and document name, address, phone, fax, and email address.
- Document plan for first follow-up appointment.

**Discharge Summary & Checklist**
- Complete transition/discharge summary:
  - Maternal history, prenatal lab results, labor and delivery course
  - Birth events, Apgar scores, measurements
  - Hospital course, lab results, procedures, medications
  - Immunizations given
  - Feeding history and detailed feeding plan
  - Growth chart with birth and transition/discharge weights
  - Follow-up appointments planned
- Send copy of transition/discharge summary to community primary care provider
  - Document acknowledgment that the intended recipient received and understood the information sent.
  - Resend information if not received.
- Give copy of transition/discharge summary to parents (in person) and evaluate parents’ understanding of content.
- Evaluate and assist with transportation issue(s), as needed.

**Primary Care Provider**
- Review name, place, time, and purpose of first follow-up appointment.
- Stress importance of initial and subsequent follow-up appointments.

**Discharge Summary & Checklist**
- Explain content of transition/discharge summary.
  - Stress importance of bringing transition/discharge summary to all follow-up appointments.
- Explain infant’s growth curve, immunization record, list of medications, feeding plan, and follow-up.
  - Ensure parents understanding of information explained.
  - Ask parents if they have any questions or concerns that have not already been addressed.
  - Provide a call-back number for general questions that come up after the family is home.
Short-Term Follow-Up Care

Late preterm infants (LPIs) should be seen by their community primary care provider within 1–2 days after transition/discharge from the hospital; the provider should assess the infant’s continued stability, review screening results, ensure ongoing safety, and evaluate the adequacy of support systems. LPIs can appear deceptively vigorous in the first day or two after birth prior to transition/discharge. It is not unusual for morbidities common to LPIs to first appear a few days after transition/discharge. If not detected and managed early, these can quickly escalate and lead to re-hospitalization, increased family stress, and even permanent disability and death.2

It is especially important that breastfeeding LPIs be seen within a day after transition/discharge because of the feeding challenges so prevalent in this population. Immature feeding patterns, such as uncoordinated suck/swallow/breathe, ineffective milk transfer, and increased sleepiness because of immature brain/central nervous system (CNS) development, may not be apparent until the mother’s milk supply increases on postpartum days 2–5. Feeding failure, in both breastfed and formula-fed newborns, can be caused by other morbidities more common in LPIs, such as respiratory distress, cold stress, sepsis, hyperbilirubinemia, low muscle tone, and decreased stamina. Congenital heart disease and patent ductus arteriosis, also more common in LPIs, should be considered for any infant with feeding failure.

The community follow-up care provider should have received a copy of the transition/discharge summary from the in-hospital care provider prior to the initial follow-up visit. To guide evaluation, the follow-up care provider should carefully review maternal and infant history, as well as the infant’s hospital course, on the first follow-up visit. Because LPIs have many needs and because it is critically important to assess carefully the issues of continued stability, screening, safety, and support, it may be necessary to schedule extra time for follow-up visits of LPIs. Short-term follow-up care should include weekly assessments until the infant reaches 40 weeks of corrected gestational age (GA) (the infant’s due date) or is clearly thriving.25 More frequent visits may be necessary if weight or bilirubin checks are indicated.

When communicating with families and providing education as listed in the Family Education column, concepts should be shared in a manner appropriate for the needs of the family including those whose first language is not English.

<thead>
<tr>
<th>HEALTHCARE TEAM</th>
<th>FAMILY EDUCATION*</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>STABILITY</strong></td>
<td></td>
</tr>
</tbody>
</table>

**Respiratory Distress**

- Assess infant for current signs of respiratory distress.
- Ask parents if infant has had any history of apnea, cyanosis, or respiratory distress.

- Reinforce LPI’s increased risk for apnea and respiratory instability, especially when in car seat and upright devices.

References: 87

</table>
| References: 88 | • Assess infant for current signs of sepsis.  
• Ask parents about any recent symptoms of sepsis.  
• Ask parents if the infant’s care givers or any of the care givers’ family members have signs of illness.  
• Reinforce LPI’s increased risk for sepsis and re-hospitalization.  
• Review ways to reduce illness:  
  » Wash hands, limit visitors, avoid crowds, protect against contact with sick people  
  » Breastfeed for as long as possible during the first year after birth or longer  
• Review signs and symptoms of sepsis:  
  » Difficulty breathing or feeding, increased or decreased temperature, decreased energy level  
• Review how to take infant’s temperature.  
• If temperature >100.4°F (38°C), take infant to primary care provider. |
| **Weight Loss** |  
| References: 2, 25, 89, 90 | • Assess weight 1–2 days after hospital transition/discharge using appropriate preterm growth curves and compare with infant’s transition/discharge weight.  
• Evaluate feeding practices if weight loss greater than appropriate for age.  
  » Ask mother about any pain with breastfeeding.  
  » Do oral exam and check for abnormalities, such as ankyloglossia, cleft palate, or thrush.  
  » Observe infant feeding (breast or bottle).  
  » Modify feeding and supplementation appropriately.  
  » If unable to observe infant feeding, immediately refer mother to lactation consultant or feeding specialist.  
  » Make appointment for repeat infant weight check.  
• Reinforce LPI’s increased risk for excessive weight loss.  
• Review normal weight-loss parameters:  
  » No more than 3% per day or total of 10% loss  
  » Regained by 14 days after birth  
• Review and validate understanding of feeding plan.  
  » Explain need for supplementation of breastmilk if infant has excessive weight loss.  
  » Explain need to prevent infant dehydration by ensuring infant has adequate fluid intake.  
• Stress importance of follow-up for weight check:  
  » Date, time, and location of follow-up appointment |
| **Feeding** |  
| References: 23 | • Determine family understanding of post-discharge feeding plan and assess adherence to plan (including iron and Vitamin D supplementation).  
• Assess current feeding practices, including type of milk, length of time feeding, amount taken (if formula fed).  
• Assess urine output, stool color, and frequency and symptoms of gastroesophageal reflux disease (GERD), colic, or oral aversion.  
• Modify feeding and supplementation plan if indicated.  
  » Encourage pumping and supplementing with expressed breastmilk if supplementation is needed for breastfed infants.  
  » Provide prescription for breast pump, if indicated.  
  » Supplement with formula only as last resort.  
• Encourage and support breastfeeding.  
  » Congratulate mother about choosing to breastfeed.  
  » Ask about pain with breastfeeding or any other concerns.  
  » Observe breastfeeding if concerns or pain are described by mother (evaluate for ankyloglossia).  
  » Make immediate referral to lactation consultant if needed.  
• Reinforce LPI’s increased risk for failure to thrive and re-hospitalization:  
  » Immature feeding skills  
  » Ineffective sucking/swallowing  
  » Uncoordinated suck/swallow/breathe; may not be seen until after increase in breastmilk supply  
  » Longer sleep cycles; may need to wake for feedings  
• Review normal feeding frequencies:  
  » 10–12 times/d for breastfeeding infants  
  » 8–10 times/d for formula-fed infants  
• Review normal urine output and stool frequency as indicators of adequate feeding intake (and lack of normal urine/stool as signs of dehydration):  
  » At least 6 wet diapers/24 h by day 5 after birth  
  » At least 1 yellow seedy stool daily by day 4 after birth  
• Review benefits of breastfeeding/breastmilk for all infants and their mothers.  
• Provide contact information for lactation specialist and community breastfeeding support. |

</tbody>
</table>
| **Hyperbilirubinemia** | - Assess infant for jaundice 1–2 d after transition/discharge.  
- Assess for any feeding difficulties or dehydration, especially if infant is breastfeeding exclusively.  
- Follow-up maternal and infant blood type and Direct Coombs tests if available.  
- Review 24-hour bilirubin level and repeated evaluation done prior to transition/discharge.  
- If concerned about elevated bilirubin, obtain Total Serum Bilirubin (TSB) or Transcutaneous Bilirubin (TcB) level (visual assessment is not reliable).  
- Arrange for repeat bilirubin check, home phototherapy with follow-up, or hospital admission, as indicated. |
| **References:** 28, 56, 64, 66, 91 | - Reinforce LPI’s increased risk for jaundice requiring hospitalization and/or phototherapy.  
  » Stress increased risk for kernicterus  
  » Review delayed peak in bilirubin levels for LPIs (at days 5–7 after birth) and possible need for additional testing to coincide with this peak.  
  » Review signs and symptoms of worsening hyperbilirubinemia:  
    » Deepening yellow skin and eye color (visual assessment alone is not reliable)  
    » Sleepiness and lethargy  
    » Decreased feeding  
    » Increased irritability with high-pitched cry  
  » Stress critical importance of follow-up with primary care provider if infant has signs or symptoms of worsening jaundice.  
  » Explain that breastfed infants are at higher risk for jaundice and need close monitoring of feedings to reduce risk of hyperbilirubinemia.  
    » Infant may need supplementation.  
    » Expressed breastmilk is ideal first choice.  
    » If mother’s own milk or donor human milk is not available, cow’s-milk-based formula may be used for supplementation. |
| **Circumcision** | - Assess circumcision site for healing. |
| **References:** | - Review normal course of healing and care of circumcised penis.  
  - Review care of intact penis if infant is uncircumcised. |
| **Newborn Care** | - Evaluate appropriateness of infant’s clothing for warmth, general cleanliness.  
  - Evaluate evidence for proper care of umbilicus and diaper area.  
  - Assess parents’ knowledge and skill regarding routine newborn care. |
| **References:** 2, 7 | - Review parents’ understanding of all routine newborn care procedures, e.g., taking temperatures, appropriate clothing, bathing, and diapering. |

» Apnea  
» Choking  
» Difficulty breathing  
» Cyanosis  
• Review CPR. |
| | • Assess and address parents’ understanding of when to call a primary care provider for urgent evaluation of infant.  
» Provide additional education as needed. |

### SUPPORT

<table>
<thead>
<tr>
<th>Family and Social Support</th>
<th>Family and Social Support</th>
</tr>
</thead>
</table>
| • Evaluate support needs and address barriers to care:  
» Family / Social support network  
» Community-based services (e.g., WIC, lactation support, social services)  
» Home health care referral  
» Ongoing infant care education  
• Ask parents if they have any questions or concerns that have not already been addressed.  
• Provide a call-back number for general questions that come up after when family is home. | • Provide verbal and written information about where to find support if needed.  
• Reinforce potential challenges of caring for LPI at home and encourage utilization of resources as needed. |
Long-Term Follow-Up Care

There is no recognized endpoint to long-term follow-up care of late preterm infants (LPIs). Because research has documented increased morbidities for LPIs during infancy, childhood, adolescence, and through adulthood, follow-up care must begin at birth and continue, with varying degrees of surveillance and reflecting individual needs, throughout the lifespan.

The importance of establishing a medical home for each LPI cannot be overemphasized. A medical home is necessary to ensure that appropriate screening and assessments are completed, referrals are made, continuity of care is coordinated and implemented by a multidisciplinary team, and duplication of services is avoided. At each follow-up visit the continued stability, screening, safety, and support of LPIs and their families should be assessed.

Ongoing follow-up care should continue to be culturally, developmentally, and age-appropriate, taking into account families’ preferences and ensuring that parents are active participants in making informed decisions about follow-up testing and therapeutic interventions. Communication should occur and education should be provided in ways that are appropriate for families with limited or no English proficiency or health literacy and in ways that are developmentally appropriate for the target audience (e.g., teen parents).

If a LPI was transitioned to a higher level of care during the initial or subsequent hospitalizations, or if the mother and infant were separated at birth, both mother and father/partner should be monitored closely for signs of postpartum depression and post-traumatic stress disorder during the postpartum period and the first year of the infant’s life. Because optimal infant development is so influenced by the mental health of the infant’s primary caregivers, especially that of the mother, referrals should be made for professional help and community support whenever indicated.

*When communicating with families and providing education as listed in the Family Education column, concepts should be shared in a manner appropriate for the needs of the family including those whose first language is not English.

<tbody>
<tr>
<td><strong>STABILITY</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Growth</strong></td>
<td></td>
</tr>
<tr>
<td>*Monitor growth parameters (weight, length, and head circumference) at each well-child visit. *Consider need for fortification or supplementation of either breastmilk or formula if infant is failing to thrive per appropriate preterm growth curves. *Assess both volume of intake and also caloric density of feeds when planning fortification or supplementation. *Reassess at each visit to determine continued need for fortification or supplementation to maintain normal growth. *Encourage fortification/supplementation in ways that encourage suckling at the breast, if possible, such as higher calorie transitional formula given at separate feeds from breastfeeding. This is preferable to giving fortified expressed milk in a bottle at each feeding, which discourages feeding at the breast. *Recommend introducing solid foods no earlier than 6 months corrected gestational age (GA) and when infant demonstrates developmental readiness.</td>
<td></td>
</tr>
<tr>

<tr>
<td>-----------------</td>
<td>------------------</td>
</tr>
<tr>
<td><strong>STABILITY (continued)</strong></td>
<td></td>
</tr>
</tbody>
</table>
| **Respiratory Illness** | • Assess parents’ understanding of ways to reduce upper respiratory infections throughout the first few years after birth.  
• Ask about signs or symptoms of asthma.  
**References:**  
105, 118 | • Reinforce increased LPI’s risk for asthma, respiratory infection and re-hospitalization during the first year after birth:  
» Respiratory syncytial virus (RSV) is the most common infectious etiology  
» High morbidity is similar to that of extremely preterm infants if admitted to the PICU  
• Review ways to avoid respiratory illness:  
» Keep immunizations current  
» Avoid crowds and contact with sick people  
» Careful and consistent handwashing  
» Protect from secondhand smoke  
» Breastfeed for as long as possible during the first year after birth or longer  
» Maintain good nutrition on a long-term basis  
» RSV prophylaxis as indicated |
| **SCREENING** | | |
| **Sensory Screening** | • Evaluate for sensory impairments, including hearing, sight, and sensory integration.  
• Follow-up brainstem auditory evoked response (BAER) results if referral had been made.  
• Monitor for syndrome of auditory neuropathy/auditory dyssynchrony (normal otoacoustic emission (OAE) with abnormal auditory brain response (ABR)).  
**References:**  
105, 106, 107, 108 | • Provide education about increased risk for sensory impairments:  
» Hearing impairment or deafness  
» Visual impairment or blindness  
» Disorders of sensory integration  
» Auditory and visual processing delay  
• Stress importance of hearing or vision follow-up  
» Review date, time, and locations of follow-up appointments.  
• Stress importance of alerting primary care provider of any concerns about hearing, vision, or speech. |
| **Developmental Screening** | • Perform regular developmental screening using valid and reliable assessment tools, such as:  
» Modified Checklist for Autism in Toddlers (MCHAT)  
» American Academy of Pediatrics’ (AAP) Bright Futures, including Pediatric Symptom Checklist (ages 4 y and up)  
» Brief Infant Toddler Social Emotional Assessment (BITSEA), for age 12–36 months; parent can fill out in 7–10 min  
• See the AAP’s websites for more tools (www.medicalhomeinfo.org) and (www.aap.org/sections/dbpeds)  
• Make referrals as indicated.  
**References:**  
2, 4, 10, 47, 75, 77, 85, 106, 109, 110, 111, 112, 113, 114, 115, 116 | • Teach about LPI’s increased risk for developmental delays:  
» Psychomotor delay  
» Cerebral palsy  
» Cognitive delay  
» Delay in school readiness  
» Increased need for special educational services  
» Increased disability (74% of total disability associated with preterm birth)  
• Stress importance of developmental follow-up.  
» Review date, time, and location of follow-up appointments. |
### Behavioral Screening

**References:** 77, 86, 106

- Ask parents about any signs of behavioral or emotional disturbances in toddler or child.
- Assess family’s support system and coping abilities.
- Make referrals as indicated.

### Maternal Screening

**References:** 36, 37, 38, 39, 40, 41, 42

- Review ingestion of illicit and prescription drugs or other substances during pregnancy and refer mother to drug or alcohol rehabilitation program, if indicated.
- Review use of prescription or herbal medications or supplements of concern, if identified.
  - Refer family members who smoke to smoking cessation program.
  - Encourage mothers who quit smoking during or just prior to pregnancy to avoid relapse (high risk during the postpartum period).
- Screen for psychiatric illness or perinatal mood disorders (including postpartum depression and post-traumatic stress disorder).
  - Parents separated from the infant at birth (e.g., due to cesarean delivery or NICU admission) are at higher risk for perinatal mood disorders.
  - Mothers of infants born prematurely are at increased risk for mood disorders in the first 6 months postpartum (three times higher than mothers of term infants).
  - Make referrals for treatment if indicated.
- Evaluate mother’s understanding of any referrals made.

REFERENCES

The Multidisciplinary Guidelines for the Care of Late Preterm Infants was created by a volunteer committee of individuals. Like the guidelines themselves, the Steering Committee was truly multidisciplinary with members representing a wide variety of disciplines in the continuum of care for late preterm infants. We would like to thank the members of this team for having the insight to recognize a need, for their vision and dedication to creating a solution, as well as for their expertise and all the time they donated to producing a tool to support the care of late preterm infants and their families.

*The Steering Committee Members disclosed no relevant financial relationships that might create a conflict of interest in the development of the guidelines.*
Collaborative Partners

Thank you to the following individuals and organizations for their participation in the initial development and review of the Multidisciplinary Guidelines for the Care of Late Preterm Infants.

Zoe’s New Beginnings
Sponsors

The development of the Multidisciplinary Guidelines for the Care of Late Preterm Infants was supported through sponsorships from Phillips Mother & Child Care and GE Healthcare Maternal-Infant Care. The organizations had no input or editing rights to the content included in the guidelines.

PHILIPS

Philips Mother & Child Care is committed to delivering the next generation of care for mother and child, right from the beginning. We provide innovative, clinically proven solutions and a broad range of support so clinicians can deliver the best care possible, every step of the way.

In the hospital, our wide range of imaging and monitoring products, developmentally supportive NICU and PICU solutions, and clinical information systems help you to work more efficiently and support more confident decisions. When it’s time to go home, Philips is there with nursing, feeding, soothing, jaundice management, and monitoring solutions.

Philips’ focus is Developmental Care, a holistic, evidence-based framework for care that provides clinicians with educational solutions designed especially to support and nurture the mother and baby. For more information, visit www.philips.com/motherandchild.

GE

With a shared passion, healthcare providers worldwide rely on GE Healthcare Maternal-Infant Care as their preferred partner to deliver clinically-appropriate, cutting-edge care solutions. Innovative products, exceptional service and clinical education combine to empower healthcare professionals to anticipate, understand and respond to the unique and ever-changing needs of mothers, babies and their families.

For over 50 years, GE Healthcare Maternal-Infant Care has offered advanced technology and innovative designs that help meet the demanding clinical care needs in Labor & Delivery and Neonatal Intensive Care. GE’s products include the Giraffe* and Panda* lines of incubators and warmers, the Corometrics* maternal-fetal monitors, resuscitation and phototherapy systems, and the Carescape* vital signs monitors for neonates.
